

RUMANIA / Human and Animal Morphology. Nervous System. 3-2
Peripheral Nervous System.

Abs Jour: Ref Zhur-Biol., No 18, 1958, 64802.

Abstract: of a knob-like and ring-like form have been found. The tiny fibers of the mucous membrane of the UB in mammals have free or encapsuled sensory endings. In the smooth musculature of the UB knob-like terminal nerve mechanisms, situated along the effector nerve fibers, are found as well as proprioceptive endings with a complex branching. In the subserous layer and smooth musculature of the UB, particularly at the points of entry of the U into the UB, there are numerous microganglia. Here, at this point dense strongly-developed sympathetic peri-neural networks are noted. The innervation of the U is poorer, but in their epithelium a larger number of interoceptive endings are found.

Title : On Nerve Endings in the Prostate

Orig Pub : Comun. Acad. RPR, 1957, 7, No. 1, 131-134.

Abstract : In the prostate gland of the guinea pig, cat, dog and mouse,
rich innervation of the gland itself, as well as its excre-
tory duct, was discovered. In smooth musculature, by the
method of impregnation, the prevalence of encapsulated sen-
sory bodies described by Timofeyev was detected.

EDACH 556N

Determination of vitamin C in vegetable tissues. G. F. F. F. F.

Anal. Inst. Cerc. agron. Roma, 1952, 4, 1955, 11, 163-170.

A number of methods of assay of vitamin C in vegetable tissues were studied and compared. The methods of Tillmans, Martini and Fongionorel were studied and compared. The method of Tillmans was used instead of HIO_4 . Hot and cold extractions were used. Hot extraction was preferable. In order to remove substances which interfere with titration and determination of vitamin C, it is considered advisable to add 25-50% ethanol. In the indophenol (Tillmans) method, the presence of ethanol causes an error of at least 2-12%. To establish (visually) the titration end point in the indophenol method, it is recommended that a standard having the same composition as the sample under titration but previously oxidized with iodine and mercuric acetate, be employed. This generally enables 93-100% of the vitamin C experimentally added to be determined. In the method of determination with methylene blue, the ratio of methylene blue used to vitamin C in the sample rises as the latter value increases. This decrease of the ratio is small to obtain satisfactory results the aliquot titrated should not contain >0.04 mg. of vitamin C. Visual determination of the end point with the aid of a standard is again recommended. The iodometric method, using KIO_4 , was also studied. The conclusions drawn are (1) that the indophenol method is sufficiently accurate, is the most simple method and has the widest sphere of application; (2) the methylene blue (Martini and Fongionorel) method gives results 3-10% lower than the indophenol method and (3) the iodometric method gives results 20-40% higher.

In the assay of total vitamin C by the Fongionorel and Fongionorel method, it was shown that, with the exception of pure vitamin C and certain vegetable extracts, the elimination of H_2S is not complete even after 8-10 hours of bubbling through $Ca(OH)_2$. The errors due to traces of H_2S are unimportant. The adjustment of the pH value to 5, prior to the treatment with mercuric acetate, is better effected with a solution of Na_2CO_3 than with solid $CaCO_3$.

1/2

2. NACAPB ...
thus avoiding an additional filtration. This method, under the
conditions established, enables a value equal to 45-105% of the
vitamin C added to be obtained. The determinations suggest
indicate that fresh fruit and vegetables contain the same
amount of vitamin C as the standard solution.

Title : The Ascorbic Acid Content of Tomatoes and Peppers in Storage Conditions and at Various Stages of Ripeness.

Orig Pub : Comun. Acad. RFR, 1956, 6, No 9, 1117-1122

Abstract : It has been determined that tomatoes at the stage of biological ripeness contain just as much ascorbic acid as those at the consumption ripeness stage. This is in contrast to peppers, which accumulate considerably more acid as they ripen. Tomatoes stored at 15° for 20 days lost insignificant quantities of ascorbic acid. Peppers, on the other hand, declined significantly in weight and ascorbic acid content after storage for 25 days.

TITLE: Increasing the internal beam current of the synchrocyclotron of the Joint
Institute for Nuclear Research by additional electrostatic focusing

SOURCE: Bulgarska akademiya na naukite. . Fizicheski institut. Izvestiya na
Fizicheskiya institut s ANEB, v. 14, 1966, 5-19

TOPIC TAGS: synchrocyclotron, electrostatic field, electrode, duant, accelerator,
rectifier, proton current

ABSTRACT: A description is given of the effects of an electrostatic field in the
central region in the synchrocyclotron of the Joint Institute of Nuclear Research
upon the accelerated proton current. As a result of theoretical and experimental
research, the chosen aperture of the focusing electrode is equal to the aperture of
the dee. In view of the need for a stable installation for long periods of work,
30-mm gaps were established between the screens and the electrodes and a 170-mm

Card 1/2

L 05392-67

ACC NR: AT6031503

distance was established between the dee and the electrodes. In such conditions the maximum current magnitude attained is $U_0 = 13$ kilovolts. As a result of the increase of focusing forces in the central region of the accelerator, the beam current on the finite radius increased from 1.1—1.2 to 2.1—2.3 μA . In conclusion, the authors thank senior technicians V. I. Ivanov and Yu. V. Maksimov for the production of the 30-kv rectifier; designer I. Kh. Nozdrin and K. A. Baycher, director of the machine shops of the Laboratory of Nuclear Problems, for their efforts in the development and production of the focusing installation, and G. I. Selivanov, chief engineer of the Laboratory of Nuclear Problems. Orig. art. has: 16 figures.

TITLE: Antioxidant additives to triethylene glycol

SOURCE: Khimiya i tekhnologiya topliv i masel, no. 12, 1966, 27-28

TOPIC TAGS: dearomatization, kerosene, gas oil, kerosene fraction, gas oil fraction, extracting agent, diethylene glycol, triethylene glycol, antioxidant, antioxidant additive, diethanolamine, topanol, corrosion, anticorrosion additive, corrosion inhibitor

ABSTRACT: The study of the stabilization of triethylene glycol with antioxidants suitable for operation at a temperature range of 160—180C was prompted by the corrosive effect on equipment of polyethylene glycols used as extracting agents at temperatures above 150C, as the experience indicated in the dearomatization of kerosens-gas oil fractions at Sumgait. As it is necessary to keep the pH of the extracting agent above 8, monoethanolamine--MEA (bp 171C) was used as an anticorrosion agent for diethylene glycol; however, in the case of the triethylene glycol, MEA cannot be used at these temperatures. Therefore, experiments were made with diethanolamine--DEA or topanol (manufactured by the firm "Oxide") by heating triethylene glycol for 1.5 to 4.5 hr at 150, 170, and 200C in a stream of either air

Card 1/2

ACC NR: AP7000772

or nitrogen. DEA and topanol were added to triethylene glycol in amounts of 0.5 and 0.1%, respectively. The results indicated that in air only DEA can keep the pH of the triethylene glycol above 8 at 200C for 1.5 hr; at lower temperatures, both DEA and topanol kept the pH level of the extractant below 8 for all the exposures. In a nitrogen stream, traces of DEA made it possible to keep the pH level of the extractant above 10 for all temperatures and exposures tested. In conclusion the author regards DEA and topanol as prospective stabilizing agents for triethylene glycol; however, the industrial dosages of these additives must be still determined more accurately.
